Serial No.: 10/795,845

Response to Office Action dated May 7, 2007

HBH Docket No.: 60046,0072US01

Amendments to the Claims

This listing of claims will replace all prior versions, and listing, of claims in the

application:

1. (Previously Presented) A method for disabling console redirection

capabilities provided by a basic input and output system (BIOS) in the presence of an

incompatible device, the method comprising:

determining whether a communications port has been enabled for utilization with a

BIOS-provided console redirection feature;

in response to determining that a communications port has been enabled for console

redirection, determining whether a device connected to the communications port is incompatible

with console redirection; and

in response to determining that an incompatible device is connected to the

communications port, disabling the BIOS-provided console redirection feature.

2. (Original) The method of Claim 1, wherein determining whether a

communications port has been enabled for utilization with a BIOS-provided console redirection

feature comprises reading configuration data stored in a non-volatile memory device to

determine whether a communications port has been enabled for utilization with a BIOS-provided

console redirection.

3. (Previously Presented) The method of Claim 2, wherein determining

whether a device connected to the communications port is incompatible with console redirection

comprises:

enabling the communications port for communication;

transmitting data on the communications port for reception by the device:

determining whether a receive buffer of the communications port contains data following

the transmission of the data on the communications port; and

2

determining that the device a connected to the communications port is incompatible with console redirection in response to determining that the receive buffer contains data following the transmission of the data on the communications port.

- 4 The method of Claim 3, wherein the BIOS-provided console (Original) redirection feature is implemented by a compressed redirection module and wherein disabling the BIOS-provided console redirection feature comprises not uncompressing or executing the redirection module.
- The method of Claim 4, further comprising in response to determining that an incompatible device is not connected to the communications port, enabling the BIOS-provided console redirection feature.
- 6. The method of Claim 5, wherein enabling the BIOS-provided console redirection feature comprises decompressing the compressed redirection module and executing the redirection module.
- 7 (Original) The method of Claim 6, wherein the incompatible device comprises one of a mouse input device, a modem, or a serial loopback device connected to the communications port.
- (Original) The method of Claim 7, further comprising executing a BIOS power-on self test procedure.
- 9 (Currently Amended) A computer storage media medium having computerexecutable instructions stored thereon which, when executed by a computer, cause the computer to perform the method of Claim 1.
 - 10. (Cancelled)

Serial No.: 10/795,845

Response to Office Action dated May 7, 2007

HBH Docket No.: 60046.0072US01

11. (Previously Presented) A method for disabling basic input and output system (BIOS) provided console redirection capabilities in the presence of a non universal asynchronous receiver transmitter (UART) device, the method comprising:

determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature;

in response to determining that a communications port has been enabled for console redirection, determining whether a non-UART device is connected to the communications port; and

in response to determining that a non-UART device is connected to the communications port, disabling the BIOS-provided console redirection feature.

- 12. (Original) The method of Claim 11, wherein determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature comprises reading configuration data stored in a non-volatile memory device to determine whether a communications port has been enabled for utilization with a BIOS-provided console redirection.
- 13. (Previously Presented) The method of Claim 12, wherein determining whether a non-UART device is connected to the communications port comprises:

enabling the communications port for communication;

transmitting data on the communications port for reception by a device connected to the communications port;

determining whether a receive buffer of the communications port contains data following the transmission of the data on the communications port; and

HBH Docket No.: 60046.0072US01

determining that a non-UART device is connected to the communications port in response to determining that the receive buffer contains data following the transmission of the data on the communications port.

- 14. (Original) The method of Claim 13, wherein the BIOS-provided console redirection feature is implemented by a compressed redirection module and wherein disabling the BIOS-provided console redirection feature comprises not uncompressing or executing the redirection module.
- 15. (Original) The method of Claim 14, further comprising in response to determining that a non-UART device is not connected to the communications port, enabling the BIOS-provided console redirection feature.
- 16. (Original) The method of Claim 15, wherein enabling the BIOS-provided console redirection feature comprises decompressing the compressed redirection module and executing the redirection module.
- 17. (Original) The method of Claim 16, wherein the non-UART device comprises one of a mouse input device, a modem, or a serial loopback device connected to the communications port.
- (Original) The method of Claim 17, further comprising executing a BIOS power-on self test procedure.
- (Currently Amended) A computer storage <u>media medium</u> having computerexecutable instructions stored thereon which, when executed by a computer, cause the computer to perform the method of Claim 11.
 - (Cancelled)
